

This quick start guide is based on firmware version 2.4.60. Please visit <https://flandersscientific.com/firmware/> if you would like to check for potential firmware updates.

The full user manual can be found at <https://flandersscientific.com/support/manuals.php>

Color System

Your monitor has arrived fully calibrated. Please leave the **Color System** option found in the Color menu set to **GaiaColor** to access the calibrated positions. The **None** option disables calibration and the **3rd Party** option is an empty and uncalibrated set of memory slots available for use with 3rd party applications.

Within the GaiaColor Color System you will find all the available Gamut, EOTF, Correlated Color Temperature, and Luminance options supported by the monitor. Any selection made within the GaiaColor mode activates a calibrated monitor state instantaneously, without having to re-profile the display, based on the last direct connect volumetric AutoCal profile data saved to the monitor's non-volatile memory.

Connectivity

The preferred configuration is single link 12Gbps or 6Gbps SDI. Quad Link 3Gbps and 1.5Gbps Square Division signals are also supported, but must be manually selected from the Video Menu.

FW 2.4.60 Known Issues List

We are already aware of the bugs below, but if you note any issues / bugs not listed here please report them to Support@FlandersScientific.com

Uploaded custom markers cannot currently be renamed or deleted, so please use with caution. A future firmware release and IPRU update will add the ability to delete custom markers.

Look LUT capability currently only compatible with HD sources.

De-interlace toggle currently inactive, monitor will process interlaced as Mode1 regardless of setting.

Panel Dimming -> ON is currently disabled. At this time the monitor only works in the reference Panel Dimming -> OFF mode.

The processed MON OUT SDI (downconvert) capability may require you to select the desired setting from the menu (e.g. 6G IN - HD OUT) and then reboot the monitor with that matching SDI IN format signal connected in order to properly activate that functionality. This bug does not impact the clean loop throughs, only the processed MON OUT SDI feature.
